| Latitude | -4.13333 |
| Start of Commitment | 2017-08-28 |
| End of Commitment | 2019-09-30 |
| Currency | EUR |
| Status | OECD approved |

Description

Infectious diseases are the most common health disorders. In developing countries, they significantly contribute to morbidity and mortality of the population, especially children less than 5 years. Some of them have a potential for epidemic spreading, some of infectious diseases we do not know still therapeutically affect, others leave permanent consequences or they are a factor for the development of chronic diseases. The Ministry of Health identified diarrheal diseases, acute respiratory infections, malaria and HIV / AIDS as a major cause of morbidity and mortality Kenyan population. These diseases are preventable by immunization, environmental management and environmental protection (access to drinking water, sanitation, hygiene, state of pollution and food safety) and through the supervision of the infectious diseases occurrence- by disease surveillance system. The strategy against infectious diseases includes preventive procedures at the local level in communities, at the level of the healthcare, notification of each case, early detection of an epidemy and the implementation of preventive action in the outbreak areas. The aim of the project is to improve the health of Kenyans, especially mothers and children less than 5 years by reducing morbidity and mortality from infectious diseases through timely prevention of epidemics by implementation of preventive and repressive action in outbreak areas and the streamlining of the infectious diseases surveillance and the conditions affecting their occurrence. These facts will be achieved by strengthening the capacity of health personnel and health centers, namely by transferring the expertise onto community health workers working in the community in area of prevention techniques for preventing the cases of infectious diseases, by capacity building of health workers working in health centers in infectious disease surveillance, in epidemic preparedness and in the implementation of a uniform reporting system of infectious diseases in health care facilities by means of ICT technologies. The project covers 3 sub-counties: Msambweni, Lunga Lunga and Kinango in Kwale county within 95 health care facilities, 95 health workers and 100 community health
